

# Dummit & Foote Ch. 2.3: Cyclic Groups and Cyclic Subgroups

Scott Donaldson

Jun. 2023

## 1. (6/18/23)

Find all subgroups of  $Z_{45} = \langle x \rangle$ , giving a generator for each. Describe the containments between these subgroups.

*Proof.* The subgroups of  $Z_{45} = \langle x \rangle$  are those cyclic groups generated by  $x^n$ , where  $n$  divides 45. These are:

- $\langle 1 \rangle = \{1\}$ , the trivial subgroup
- $\langle x^{15} \rangle = \{1, x^{15}, x^{30}\} \cong \mathbb{Z}/3\mathbb{Z}$
- $\langle x^9 \rangle = \{1, x^9, x^{18}, x^{27}, x^{36}\} \cong \mathbb{Z}/5\mathbb{Z}$
- $\langle x^5 \rangle = \{1, x^5, x^{10}, x^{15}, x^{20}, x^{25}, x^{30}, x^{35}, x^{40}\} \cong \mathbb{Z}/9\mathbb{Z}$
- $\langle x^3 \rangle = \{1, x^3, x^6, \dots, x^{39}, x^{42}\} \cong \mathbb{Z}/15\mathbb{Z}$
- $\langle x \rangle = Z_{45}$  itself

Among these subgroups, we have  $\langle 1 \rangle$  contained within every other subgroup, as well as  $\langle x^{15} \rangle \leq \langle x^5 \rangle$ ,  $\langle x^{15} \rangle \leq \langle x^3 \rangle$ , and  $\langle x^9 \rangle \leq \langle x^3 \rangle$ .  $\square$

## 2. (6/19/23)

If  $x$  is an element of the finite group  $G$  and  $|x| = |G|$ , prove that  $G = \langle x \rangle$ . Give an explicit example to show that this result need not be true if  $G$  is an infinite group.

*Proof.* Let  $|x| = |G| = n < \infty$ . By definition,  $G$  is closed, so it contains all powers of  $x : 1, x, x^2, \dots, x^{n-1}$ . These are exactly  $n$  elements, so  $G$  contains no other elements. It is therefore generated by  $x$ , that is,  $G = \langle x \rangle$ .

However, if  $G$  is an infinite group and  $x \in G$  with  $|x| = \infty$ , then this is not necessarily the case. For example, if  $G = \mathbb{Z}$  and  $x = 2$ , then  $x$  generates all even integers in  $\mathbb{Z}$ , but does not generate the element 5.  $\square$

### 3. (6/19/23)

Find all generators for  $\mathbb{Z}/48\mathbb{Z}$ .

*Proof.* From Proposition 6., the generators for  $\mathbb{Z}/48\mathbb{Z}$  are those positive integers  $n < 48$  for which  $n$  is relatively prime to 48. These are: 1, 5, 7, 11, 13, 17, 19, 23, 25, 29, 31, 35, 37, 41, 43, and 47.  $\square$

### 4. (6/19/23)

Find all generators for  $\mathbb{Z}/202\mathbb{Z}$ .

*Proof.* As above, the generators for  $\mathbb{Z}/202\mathbb{Z}$  are those positive integers  $n < 202$  for which  $n$  is relatively prime to 202. The integer 202 only has two divisors greater than 1, namely 2 and 101. Therefore the generators of  $\mathbb{Z}/202\mathbb{Z}$  are every odd positive integer less than 202 except for 101.  $\square$

### 5. (6/19/23)

Find the number of generators for  $\mathbb{Z}/49000\mathbb{Z}$ .

*Proof.* We are concerned with the number of integers  $n$  between 0 and 48999 for which  $n$  is relatively prime to 49000. It will be helpful to write 49000 uniquely as the product of primes:  $2^3 \cdot 5^3 \cdot 7^2$ .

Let us first consider the generators for  $\mathbb{Z}/49000\mathbb{Z}$  between 0 and 69, that is, all the numbers that are relatively prime to 49000 between 0 and 69: 1, 3, 9, 11, 13, 17, 19, 23, 27, 29, 31, 33, 37, 39, 41, 43, 47, 51, 53, 57, 59, 61, 67, and 69. There are 24 such generators.

Next, we show that, for any  $n \in \{0, \dots, 48999\}$ , the greatest common divisor of  $n$  and 49000 is equal to the greatest common divisor of  $n \bmod 70$  and 49000. This is because 70 is equal to the product of the bases of the prime factors of 49000:  $70 = 2 \cdot 5 \cdot 7$ . So for any  $n$ , we have  $n = m + 70k = m + (2 \cdot 5 \cdot 7)k$ , where  $m \in \{0, \dots, 69\}$  and  $k \geq 0$ . Suppose that  $m$  is *not* in the list of the above generators (that is, that the greatest common divisor of  $m$  and 49000 is greater than 1). Then either 2, 5, or 7 divides  $m$  (otherwise  $m$  would be relatively prime to 49000). Without loss of generality, suppose that 2 divides  $m$ , and write  $m = 2p$ . We can then rewrite  $n$  as:

$$n = m + (2 \cdot 5 \cdot 7)k = 2p + (2 \cdot 5 \cdot 7)k = 2(p + (5 \cdot 7)k),$$

that is, 2 divides  $n$ , so it is not relatively prime to 49000 (similarly, if 5 or 7 divide  $m$ , then 5 or 7 also divide  $n$ , respectively). It follows that the generators for  $\mathbb{Z}/49000\mathbb{Z}$  between 0 and 69 repeat (mod 70) over the rest of 49000. Since  $49000/70 = 700$ , there are thus  $700 \cdot 24 = 16800$  generators for  $\mathbb{Z}/49000\mathbb{Z}$ .  $\square$

## 6. (6/20/23)

In  $\mathbb{Z}/48\mathbb{Z}$  write out all elements of  $\langle \bar{a} \rangle$  for every  $\bar{a}$ . Find all inclusions between subgroups in  $\mathbb{Z}/48\mathbb{Z}$ .

*Proof.* Subgroup of order 48:  $\langle \bar{1} \rangle = \langle \bar{5} \rangle = \langle \bar{7} \rangle = \langle \bar{11} \rangle = \langle \bar{13} \rangle = \langle \bar{17} \rangle = \langle \bar{19} \rangle = \langle \bar{23} \rangle = \langle \bar{25} \rangle = \langle \bar{29} \rangle = \langle \bar{31} \rangle = \langle \bar{35} \rangle = \langle \bar{37} \rangle = \langle \bar{41} \rangle = \langle \bar{43} \rangle = \langle \bar{47} \rangle$ .

Subgroup of order 24:  $\langle \bar{2} \rangle = \langle \bar{10} \rangle = \langle \bar{14} \rangle = \langle \bar{22} \rangle = \langle \bar{26} \rangle = \langle \bar{34} \rangle = \langle \bar{38} \rangle = \langle \bar{46} \rangle$ .

Subgroup of order 16:  $\langle \bar{3} \rangle = \langle \bar{9} \rangle = \langle \bar{15} \rangle = \langle \bar{21} \rangle = \langle \bar{27} \rangle = \langle \bar{33} \rangle = \langle \bar{39} \rangle = \langle \bar{45} \rangle$ .

Subgroup of order 12:  $\langle \bar{4} \rangle = \langle \bar{20} \rangle = \langle \bar{28} \rangle = \langle \bar{44} \rangle$ .

Subgroup of order 8:  $\langle \bar{6} \rangle = \langle \bar{18} \rangle = \langle \bar{30} \rangle = \langle \bar{42} \rangle$ .

Subgroup of order 6:  $\langle \bar{8} \rangle = \langle \bar{40} \rangle$ .

Subgroup of order 4:  $\langle \bar{12} \rangle = \langle \bar{36} \rangle$ .

Subgroup of order 3:  $\langle \bar{16} \rangle = \langle \bar{32} \rangle$ .

Subgroup of order 2:  $\langle \bar{24} \rangle$ .

Subgroup of order 1, the trivial subgroup:  $\{0\}$ .

Among these subgroups, all contain the trivial subgroup. The subgroups of order 2 and 3 are distinct, but both are contained in the subgroup of order 6. The subgroup of order 2 is also contained in the subgroup of order 4. The subgroups of order 4 and 6 are both contained in the subgroup of order 12. The subgroup of order 4 is also contained in the subgroup of order 8. The subgroups of order 8 and 12 are both contained in the subgroup of order 24. The subgroup of order 8 is also contained in the subgroup of order 16.  $\square$
