Dec. 2023

Let G be a group and A be a nonempty set.

1. (12/24/23)

Let G act on the set A. Prove that if $a, b \in A$ and $b = g \cdot a$ for some $g \in G$, then $G_b = gG_ag^{-1}$ (G_a is the stabilizer of a). Deduce that if G acts transitively on A then the kernel of the action is $\cap_{g\in G}\, gG_ag^{-1}$.

Proof. We will show first that G_b, the stabilizer of b, is contained in gG_ag^{-1}, and then show the converse, which proves that they are equal.

Let $x \in G_b$, so $x \cdot b = b$. Then:

$$\begin{aligned} x \cdot g \cdot a &= g \cdot a \ (b = g \cdot a) \\ (gg^{-1}) \cdot (xg) \cdot a &= g \cdot a \ (gg^{-1} = 1, 1 \cdot a = a) \\ g \cdot (g^{-1}xg) \cdot a &= g \cdot a \\ (g^{-1}xg) \cdot a &= a, \end{aligned}$$

which implies that $g^{-1}xg \in G_a$, and therefore $x \in gG_ag^{-1}$, so $G_b \subseteq gG_ag^{-1}$.

The converse, that $gG_ag^{-1} \subseteq G_b$, can be shown by following the above proof in reverse (that is, let $x \in gG_ag^{-1}$, so $g^{-1}xg \in G_a$, which implies that $(g^{-1}xg) \cdot a = a$, and each assertion holds from bottom to top). Since each is contained in the other, we have $G_b = gG_ag^{-1}$.

Now we already know that the kernel of the group action of G on A is the intersection of the stabilizers of all the elements of A, that is, $\cap_{b\in A}\, G_b$. If G acts transitively on A, fixing $a \in A$, then for all $b \in A$, we can write $b = g \cdot a$ for some $g \in G$, which from above implies that $G_b = gG_ag^{-1}$. We deduce that the kernel can be expressed in terms of a fixed element a, namely:

$$\cap_{b\in A}\, G_b = \cap_{b\in A} \underbrace{gG_ag^{-1}}_{b=g\cdot a} = \cap_{g\in G}\, gG_ag^{-1}.$$

We know that $\cap_{g\in G}\, gG_ag^{-1}$ intersects all of the same conjugates as does $\cap_{b\in A}$, since G acts transitively on A. And, since $b = g\cdot a \Rightarrow G_b = gG_ag^{-1}$, it intersects no conjugates not represented by G_b for all $b \in A$. $\square$
